

Reverse circulation drilling water well drilling rig video

Why is reverse circulation drilling better than direct circulation drilling?

The reverse circulation drilling has higher drilling efficiency, and can get better quality well hole and longer life time for drill bit. The total cost is lower - compared to direct circulation drilling, it is around \$5 lower per meter. 6. Larger diameter hole can be drilled

What is a reverse circulation drill?

The reverse circulation drilling process is highly efficient and effective at removing rock and debris from the hole. This is due to the powerful air flow created by the reverse circulation drill bit, which is capable of carrying large volumes of material to the surface.

What is a reverse circulation drilling rig?

RC drilling rigs offer a reliable solution for obtaining accurate geological data and are essential tools in early-stage resource assessment and engineering site evaluation. A reverse circulation drilling rig is a drilling equipment suitable for vertical or inclined drilling.

How does a reverse circulation drill bit work?

The reverse circulation drill bit operates by creating a high-pressure air flow that is directed downwards into the hole. This air flow is created by a compressor, which pumps air into the drill pipe at a high velocity. The air is then forced through the drill bit and into the hole, creating a powerful cyclonic effect.

Why should you use a downhole hammer in reverse circulation drilling?

The downhole hammer used in reverse circulation drilling is capable of delivering a higher frequency of blows per minute, resulting in faster penetration rates and reduced drilling time. This increased efficiency can be particularly beneficial in large-scale mining and exploration projects, where time and cost considerations are critical.

What is the difference between RC drilling and DC drilling?

Configuration of Reverse Circulation Borehole Drilling System Here are the main advantages of RC (reverse circulation) drilling compared to DC (direct circulation) drilling: For gravel cobble it is 1 - 1.5 m/h. For f 4 - f 6 level rock condition it is 1 - 3 m/h. In general, drilling speed is 1.2 - 3 times faster than direct circulation drilling. 2.
